

MENT-062

This Response To Office Action is in response to the Office Action mailed November 10, 2003.

In the Claims

1 1 (currently amended). An arrangement for generating a representation of a feature in a surface
2 defined by a mesh representation, the mesh comprising at a selected level a plurality of points
3 including at least one point, referred to as a vertex, connected to a plurality of neighboring points by
4 respective edges, the feature being defined in connection with the vertex and at least one of the
5 neighboring points and the edge interconnecting the vertex and the at least one of the neighboring
6 points in the mesh representation, the feature generating arrangement comprising:

- 7 A. a weight vector generator module configured to generate at least one weight vector based on
8 a parameterized subdivision rule defined at a plurality of levels, for which a value of at least
9 one parameter differs at at least two levels in the mesh; and
10 B. a feature representation generator module configured to use the at least one weight vector and
11 positions of the vertex and the neighboring points to generate the representation of the feature.
- AM
CMF
10*

1 2 (currently amended). An arrangement as defined in claim 1 in which the weight vector generator
2 module is configured to make use of values of the at least one parameter that differ at at least two
3 levels are related by a selected mathematical function.

1 3 (original). An arrangement as defined in claim 1 in which the feature is a smooth feature line.

1 4 (currently amended). An arrangement as defined in claim 3 in which the smooth feature line is
2 defined in connection with the vertex and two neighboring points and edges interconnecting the vertex
3 and the respective neighboring points, the weight vector generator module being configured to make
4 use of the parameterized subdivision rule having a parameter value associated with each of the edges
5 along which the smooth feature line is defined.

MENT-062

1 5 (original). An arrangement as defined in claim 4 in which the weight vector generator module is
2 configured to make use of parameters associated with the edges along which the smooth feature line
3 is defined whose values are the same.

1 6 (original). An arrangement as defined in claim 5 in which the weight vector generator module is
2 configured to make use of the parameters that are in relation to a subdivision rule that, in turn, reflects
3 a sharp crease along the edges along which the smooth feature line is defined, the values of the
4 parameters being defined in the interval [0,1], where higher values define a sharper crease, the values
5 of the parameters at a lower level being related to the values of the parameters at a higher level being
6 related by

$$s(j+1) = (s(j))^2$$

*Al

1 105 (currently amended). A method for generating a representation of a feature in a surface defined
2 by a mesh representation, the mesh comprising at a selected level a plurality of points including at
3 least one point, referred to as a vertex, connected to a plurality of neighboring points by respective
4 edges, the feature being defined in connection with the vertex and at least one of the neighboring
5 points and the edge interconnecting the vertex and the at least one of the neighboring points in the
6 mesh representation, the method comprising:

- 7 A. a weight vector generator step configured to generate at least one weight vector based on a
8 parameterized subdivision rule defined at a plurality of levels, for which a value of at least one
9 parameter differs at at least two levels in the mesh; and
10 B. a feature representation generator step configured to use the at least one weight vector and
11 positions of the vertex and the neighboring points to generate the representation of the feature.

1 106 (currently amended). A method as defined in claim 105 in which the weight vector generator step
2 includes the step of making use of values of the at least one parameter that differ at at least two levels
3 are related by a selected mathematical function.

MENT-062

- 1 107 (original). A method as defined in claim 105 in which the feature is a smooth feature line.
- 1 108 (currently amended). A method as defined in claim 107 in which the smooth feature line is
2 defined in connection with the vertex and two neighboring points and edges interconnecting the vertex
3 and the respective neighboring points, the weight vector generator step includes including the step of
4 making use of the parameterized subdivision rule having a parameter value associated with each of
5 the edges along which the smooth feature line is defined.
- 1 109 (original). A method as defined in claim 108 in which the weight vector generator step includes
2 the step of making use of parameters associated with the edges along which the smooth feature line
3 is defined whose values are the same.
- 1 110 (original). A method as defined in claim 109 in which the weight vector generator step includes
2 the step of making use of the parameters that are in relation to a subdivision rule that, in turn, reflects
3 a sharp crease along the edges along which the smooth feature line is defined, the values of the
4 parameters being defined in the interval [0,1], where higher values define a sharper crease, the values
5 of the parameters at a lower level being related to the values of the parameters at a higher level being
6 related by

$$s(j+1) = (s(j))^2 ,$$

7
8 where s(j) represents the values of the parameters at level "j" and s(j+1) represents the values of the
9 parameters at the higher level "j+1."

1 111 (original). A method as defined in claim 108 in which the weight vector generator step includes
2 the step of making use of parameters associated with the edges along which the smooth feature line
3 is defined whose values differ.

1 112 (original). A method as defined in claim 111 in which the weight vector generator step includes
2 the step of making use of the parameters that are in relation to a subdivision rule that, in turn, reflects
3 a sharp crease along the edges along which the smooth feature line is defined, the values of the

MENT-062

4 parameters being defined in the interval [0,1], where higher values define a sharper crease, the values
 5 of the parameters at a lower level being related to the values of the parameters at a higher level being
 6 related by

$$s_1(j+1) = \left(\frac{3}{4}s_1(j) + \frac{1}{4}s_2(j) \right)^2 ,$$

7
 8 and

$$s_2(j+1) = \left(\frac{1}{4}s_1(j) + \frac{3}{4}s_2(j) \right)^2 ,$$

MJ
10
11 where $s_1(j)$ and $s_2(j)$ represent the values of the parameters associated with the respective edges at
12 level "j," and $s_1(j+1)$ and $s_2(j+1)$ represent the values of the parameters associated with the respective
 edges at the higher level "j+1."

1 113 (original). A method as defined in claim 108 in which the mesh comprises a triangular mesh in
 2 which, at a selected level "j," vertex $v_q(0)$ is at position $c^j(0)$ and neighboring points $v_q(k)$, $k=1,...,K$
 3 are at respective positions $c^j(k)$, and in which the weight vector generator step includes the step of
 4 making use of a parameterized subdivision rule $S_{sc,T,K,L}$ that relates the position $c^{j+1}(0)$ of the vertex
 5 $v_q(0)$ and positions $c^{j+1}(k)$ of neighboring points $v_q(k)$ at the next higher level "j+1" as follows

$$c^{j+1} = S_{sc,T,K,L} c^j ,$$

6
 7 where subdivision rule $S_{sc,T,K,L}$ is given by

MENT-062

[Handwritten signature]

$$\left(S_{sc,T,K,L}(s_1, s_2) \right)_{l,m} = \begin{cases} (1 - s_3)(1 - \alpha(K)) + \frac{3}{4}s_3 & \text{if } l = 0, m = 0 \\ (1 - s_3) \frac{\alpha(K)}{K} + \frac{1}{8}s_3 & \text{if } l = 0, m = 1 \text{ or } L+1 \\ (1 - s_3) \frac{\alpha(K)}{K} & \text{if } l = 0, m = 2, \dots, L \\ & \text{or } l = 0, m = L+2, \dots, K \\ \frac{3}{8} + \frac{1}{8}s_2 & \text{if } l = 1, m = 0 \text{ or } 1 \\ \frac{3}{8} + \frac{1}{8}s_1 & \text{if } l = L+1, m = 0 \text{ or } L+1 \\ \frac{1}{8}(1 - s_2) & \text{if } l = 1, m = 2 \text{ or } K \\ \frac{1}{8}(1 - s_1) & \text{if } l = L+1, m = L \text{ or } L+2 \\ \frac{3}{8} & \text{if } l = 2, \dots, L, m = 0 \\ & \text{or } l = L+2, \dots, K, m = 0 \\ & \text{or } l = m = 2, \dots, L \\ & \text{or } l = m = L+2, \dots, K \\ \frac{1}{8} & \text{if } l = 2, \dots, L, m = l-1 \\ & \text{or } l = L+2, \dots, K, m = l-1 \\ & \text{or } l = 2, \dots, L, m = l+1 \\ & \text{or } l = L+2, \dots, K, m = l+1 \\ & \text{or } l = K, m = 1 \\ 0 & \text{otherwise} \end{cases}$$

8

9 where the smooth feature line is defined in connection with the edges between respective points $v_q(1)$

1 143 (original). A method as defined in claim 135 in which the representation of the feature is defined
 2 by a tangent vector associated with the vertex, the tangent vector being along the smooth feature line,
 3 the feature representation generator step includes the step of determining the tangent vector $e_c(q)$ in
 4 accordance with

$$e_c(q) = \sum_{i=0}^{2K} \left(l_c(s_1, s_2) \right)_i c^i(i) ,$$

5

6 where $l_c(s_1, s_2)$ is a vector of tangent vector weight values defined by

$$l_c(s_1, s_2) = d(K)^K v_c \cdot S_{sc,Q,K,L,Lp}(s_1(j), s_2(j)) ,$$

7

8 where

$$S_{sc,Q,K,L,Lp}(s_1, s_2) = \prod_{j=\infty}^{J_p} S_{sc,Q,K,L}(s_1(j), s_2(j)) ,$$
